Dear HR:

I am currently a second year student at the University of California, Berkeley, studying Electrical Engineering and Computer Science interested in hardware and software internships.

I live to create. Be it software or hardware, when I get inspired to make something, I try my very best to accomplish it. My passion for engineering motivates me to pursue a wide range of projects, from smaller tasks like hosting and maintaining my own git server to more ambitious undertakings, such as building a rfid activated doors and arcade fight sticks from scratch. Moreover, I enjoy brainstorming new project ideas to tackle so I can constantly be working to advance my skillset. While not all of my endeavors end up successful in the way I originally plan, I strive to learn from every experience.

While I spend much of my time surrounded by my work bench of electrical tools and my sizable medley of computers, I also devote myself to making music, practicing karate, enjoying the outdoors, and teaching. Above all, teaching has been a very rewarding experience for me. I get to interact with a wide age range of people teaching all sorts of subjects, from teaching third graders reading comprehension to teaching fourth year college students circuit analysis. The most rewarding part of teaching would be seeing passionate students conquer difficult subjects and light up.

I look forward to learning more about this internship opportunity and its qualifications. Please do not hesitate to contact me with any questions. Thank you for your time and consideration.

Sincerely,

Seiya Ono
